The probe has two possible conformations. As a singul strand it can fold back on itself to form a binding element for the transcription factor. As a double strand, it has two binding sites for the transcription factor (both in the sense and antisense orientation). The specification describes the expression of at least 1 gene which is induced in a cell by treating with a transcription factor decoy oligonucleotide directed against a sequence encoding a shear stress response element (SSRE). The method is used to produce hormones, toxin receptors and shear stress-dependent molecules, e.g. erythropoietin (EPO) for treatment of anaemia in dialysis or AIDS patients, and many forms of cancer. Also cells expressing these molecules are useful for blochemical, toxicological or pharmacological studies or as hormone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Production of functional microgravity conditions, oligonucleotide directed

The probe has two possible conformations. As a singular strand it can fold back on itself to form a binding element for the transcription factor. As a double strand, it has two binding sites for the transcription factor (both in the sense and antisense orientation). The specification describes the expression of at least 1 gene which is induced in a cell by treating with a transcription factor decoy oligonucleotide directed against a sequence encoding a shear stress response element (SSR). The method is used to produce hormones, toxin receptors and shear stress-dependent molecules, e.g. erythropotetin (EPO) for treatment of anaemia in dialysis or AIDS patients, and many forms of cancer. Also cells expressing these molecules are useful for biochemical trainfological or pharmacological studies or as hormone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Production of functional proteins - by culturing cells und microgravity conditions, and inducing gene expression with oligonucleotide directed against shear stress response ele
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 22 BP; 5 A; 6 C; 6 G; 5 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               compounds to generate a hierarchy of the compounds ranked in accordance with their respective ability to form physical interactions with the molecular interaction site. The method also describes (1) RNA comprising a joined sequence of at least 24 nucleotides but not more than 70 nucleotides and having secondary structure defined by: (a) 3 nucleotides forming a first side of an internal loop region; (b) 2 nucleotides forming a first side of an internal loop region; (c) 4 nucleotides forming a first side of a second ds region; (d) 4 or 5 nucleotides forming an end loop region; (e) 4 nucleotides forming a second side of the second ds region; (e) 3 nucleotides forming a second side of the internal loop region; and (g) 3 nucleotides forming a second side of the internal loop region; and (g) 3 nucleotides forming a second side of the internal loop region; and (g) 3 nucleotides forming a second side of the first ds region; (f) 4 nucleotides forming a second side of the human sequence UUUXCAACAUAAUCGUUUACAGAAAAUC (II). The methods and products can be used for identifying agents which modulate the activity of biomolecules, particulatival or industrial compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           a joined sequence of at least 24 nucleotides but not more than 70 nucleotides and having secondary structure defined by: (a) 3 nucleotides forming a first gide of a first double stranded (ds) region; (b) 2 nucleotides forming a first side of an internal loop region; (c) 4 nucleotides forming a first side of a second ds region; (d) 4 or 5 nucleotides forming an end loop region; (e) 4 nucleotides forming a second side of the second ds region; (f) 4 nucleotides forming a second side of the internal loop region; (f) 4 nucleotides forming a second side of the first ds region; (2) a purified and isolated RNA fragment comprising the human sequence UVUACAACAUANUCUNGUUVACAGAAAAAUC (II). The methods and products can be used for identifying agents which modulate the activity of biomolecules, particularly RNA. Such agents can be used as pharmaceutical, agricultural or industrial compounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      compounds to generate a hierarchy of the compounds ranked in accordance with their respective ability to form physical interactions with the molecular interaction site.                                                                                                                                                                                                                                       The invention relates to a farnesyltransferase with a histidine t and methods for preparing it. The current sequence represents DNA sequence 2 relative to the farnesyltransferase of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a farnesyltransferase with a histidine tag, and methods for preparing it. The current sequence represents DNA sequence 2 relative to the farnesyltransferase of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 33 BP; 8 A; 8 C; 12 G; 5 T; 0

The method comprises:
(i) providing a number of different duplex polynucleotides, each having the same polynucleotide ligand binding site and a randomly synthesised sequence flanking the binding site; (ii) exposing the duplex to a ligand selective for the binding site; (iii) isolating duplexse which bind or do not bind the ligand, and (iv) determining the nucleotide composition of the flanking duplex sequence by sequencing the duplex sequence adjacent to the binding site. The invention is used to modulate the ligand-binding characteristics of any nucleotide sequence. The invention is less costly and more efficient than prior art techniques that moderate ligand binding using small molecule pharmaceuticals. Sequences AR295762-296170 represent polynucleotide sequences including the binding site for the restriction arrayme Pamur and used in the course of the contraction of the formal properties of the course

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       the same polynucleotide ligand binding site and a randomly synthesised sequence flanking the binding site; (ii) exposing the duplex to a ligand selective for the binding site; (iii) isolating duplexes which bind or do not bind the ligand, and (iv) determining the nucleotide composition of the flanking duplex sequence by sequencing the duplex sequence adjacent to the binding site. The invention is used to modulate the ligand-binding characteristics of any nucleotide sequence. The invention is less costly and more efficient than prior art techniques that moderate ligand binding using small molecule pharmaceuticals. Sequences AAZ95762-796170 represent polynucleotide sequences including the binding site for the restriction enzyme BamHI and used in the course of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention provides a method for determining the sequence of polynucleotide flanking regions that modulate ligand binding characteristics of an adjacent binding site. The method comprises:

(i) providing a number of different duplex polynucleotides, each having

cc method for the recombinant production of hexapetaloid duplicon-containing transferase 11. The present invention additionally discloses an cc antagonist of hexapetaloid duplicon-containing transferase 11 for therapeutic use, and an antibody which specifically binds to the protein. CC Hexapetaloid duplicon-containing transferase 11 for cc encode it may be used for treating a variety of diseases, such as cc malignant tumours, blood diseases, Hr (human immunodeficiency virus) cc infection, immune disorders and inflammatory conditions. The protein may calso be used to screen for modulators of its activity or for peptide cf ingerprinting identification. The polynucleotide can be used as primer for nucleic acid amplification reactions or as a probe for hybridisation cr reactions, or in producing gene chips or microarrays. Sequences cc AAH46200-AAH46201 represent PCR primers used in an exemplification of the invention to amplify human hexapetaloid duplicon-containing transferase 11 cDNA for cloning.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to human hexapetaloid duplicon-containing CC transferase 11 (AAB97610), nucleic acids encoding it (AAH46197), and a CC method for the recombinant production of hexapetaloid duplicon-containing CC transferase 11. The present invention additionally discloses an CC antagonist of hexapetaloid duplicon-containing transferase 11 for the protein containing transferase 11 for CC therapetaloid duplicon-containing transferase 11, and nucleotides which concode it may be used for treating transferase 11, and nucleotides which CC encode it may be used for treating a variety of diseases, such as mailtoniant tumours, blood diseases, HIV (human immunodeficiency virus) infection, immune disorders and inflammatory conditions. The protein may also be used to screen for modulators of its activity or for peptide CC infections of amplification. The polynucleotide can be used as a primer for nucleic acid amplification reactions or as a probe for hybridisation creactions, or in producing gene chips or microarrays. Sequences CC AAH46200-AAH46201 represent PCR primers used in an exemplification of the invention to amplify human hexapetaloid duplicon-containing CC transferase 11 cDNA for cloning.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal CI infectious agents e.g. Cryptococcus neoformans, Candida albicans and CR Aspergillus funigatutus, viruses e.g. T-cell lymphocytotrophis cirus, CR Egstein-Barr virus and polio virus, and parasitic infectious agents CR Egstein-Barr virus and polio virus, and parasitic infectious agents CR endinesis. The method is also useful for detecting genetic diseases such CR elityphocytotrophis cirus, and parasitic infectious agents CR endinesis. The method is also useful for detecting genetic diseases such CR elityphocytase deficiency, Turner Syndrome and obselty defects.
CR estable cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the CR enver is specifically associated with a gene selected from BRCA1 gene, p53 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning cleation microscope and infrared microscope) the support at the CR electron microscope and infrared microscope) the support at the CR paracicular sites and identifying if ligation of the oligonucleotide probe sets occurred and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC oligonuclectide probes (II) for use on a support to which complementary CC oligonuclectide probes (II) will hybridise with little mismatch, where C(I) have melting temperatures within a narrow range. The method is useful CC for detecting infectious diseases caused by bacterial infectious agents c.g. Cryptococcus neoformans, Candida albicans and CC Aspergillus funigatus, viruses e.g. T-cell lymphocytotrophis cirus, CC Epstein-Barr virus and polio virus, and parasitic infectious agents c.g. Epstein-Barr virus and polio virus, and parasitic infectious agents CC medinesis. The method is also useful for detecting genetic diseases such CC as 21 hydroxylase deficiency, Turner Syndrome and obesity defects. CC petecting cancer involving oncogenes, tumour suppressor genes, or genes cinvolved in DNA amplification, replication, recombination or repair, the CC cancer is specifically associated with a gene selected from BRCA1 gene, CC particular sites and infrared microscope) the support at the comparition or absence of the target nucleotide sequences. ABI82074 to a free present oligonuclectide sequences used in the exemplification to a confirmation or absence of the target nucleotide sequences. ABI82074 to of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              \begin{smallmatrix} \mathbf{v} \times \mathbf{0} & \mathbf{0}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 14
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC for detecting infectious diseases caused by bacterial infectious agents
CC e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal
CC infectious agents e.g. Cryptococcus neoformans, Candida albicans and
CC Aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus,
CC Epstein-Barr virus and polio virus, and parasitic infectious agents
CC medinesis. The method is also useful for detecting genetic diseases such
CC as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.
CC Detecting cancer involving oncogenes, tumour suppressor genes, or genes
CC involved in DNA amplification, replication, recombination or repair, the
CC cancer is specifically associated with a gene selected from BRCA1 gene,
CC p3 gene, human papillomavirus types 16 and 1 liver cancers. The
CC method is also used for environmental monitoring, forensics and the food
CC and feed industry, detecting comprises scanning (using e.g. a scanning
CC electron microscope and infrared microscope) the support at the
CC gets occurred and correlating (using a computer) identified ligation to a
CC presence or absence of the target nucleotide sequences. AB182074 to

The method is useful (I) have melting temperatures within a narrow range. The method is useful conditions agents e.g. Cryptococcus neoformans, Candida albicans and infectious agents e.g. Cryptococcus neoformans, Candida albicans and C1 Aspergillus fundaquitus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents complements. The method is also useful for detecting genetic diseases such considered from Onchoverva volvulus, Entamoeba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such contecting cancer involving oncogenes, tumour suppressor genes, or genes cinvolved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, by 3 gene, human papillomavirus types 16 and 18 and liver cancers. The comparison provision of the support at the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the food condition of the oligonucleotide probe sets occurred and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences. ABI82074 to a ferb present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ABI87775

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, p53 gene, human papillomavirus types 16 and 18 and 11ver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises canning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonucleotide probe sets occurred and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences. ABI82074 to ABI97546 represent oligonucleotide sequences used in the exemplification of the present invention.

```
described are: (1) plasmids or baculovirus transfer vectors that contain (1); and (2) recombinant protein (IV) consisting of the A and B chains of (II) joined by the specified linker. (IV), produced by expression of (I) in host cells, are used to inhibit or kill diseased cells that produce (III), particularly for treating cancers (e.g. leucocyte proliferation; cancer of owary, pancreas, breast or prostate; glioma) or infections caused by fungi, parasites (e.g. malaria) or viruses (e.g. cytomegalovirus (CMV), herpes, hepatitis, rhinovirus, laryngeotracheitis, poliomyelitis or varicella roster), also cystic fibrosis and multiple sclerosis. Alternatively, (I) is used to express (IV) in vivo. (IV) is
                                                                              sclerosis. Alternatively, (I) is used to express (IV) in vivo. (IV) is toxic specifically for (III) expressing cells and does not depend for specificity on a cell-binding component. When used to treat virus-infected cells, transcytosis and cytotoxicity of (IV) are increased by retrograde translocation from endoplasmic retroulum to cytoplasm (which some viruses exploit to avoid immune detection), so selectivity and safety are further improved. (IV) are not toxic until chain A is released and this occurs only in target cells. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cleaved by protease - is e.g. killing selectively

A novel composition has been developed which comprises an immunoglobulir (1g) having an affinity constant (Ka) of at least 2 multiply 1000000000 M-1 for binding to a predetermined human antigen. The present sequence represents a PCR primer involved in the light chain PCR reaction 2 for the production of a synthetic kappa light chain. Anti-CD4 antibodies may be used in therapeutic and diagnostic applications, especially for the treatment of human diseases. These antibodies reduce activity of CD4 cells and reduce undesirable autoimmune reactions,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (Ig) having an affinity constant (Ka) of at least 2 multiply 1000000000 M-1 for binding to a predetermined human antigen. The present sequence represents a PCR primer involved in the light chain PCR reaction 2 for the production of a synthetic kappa light chain. Anti-CD4 antibodies may be used in therapeutic and diagnostic applications, especially for the treatment of human diseases. These antibodies reduce activity of CD4 cells and reduce undesirable autoimmune reactions, inflammatory response and transplant rejection. Transgenic animals are capable of producing heterologous antibodies of multiple isotypes by undergoing isotype switching. These animals produce a first Ig type that is necessary for antigen-stimulated B-cell maturation and can

          Oligonucleotides AAV39256-64 were used to create a synthetic kappa light CC chain. Oligonucleotides AAV39256-64 were pooled, and amplified with CC chain. Oligonucleotides AAV39265-64 were pooled, and amplified with the CC AAV39248 and AAV39265. The amplification product was combined with the CC product of oligonucleotides AAV39244-53, and then amplified. The sequence was then cloned into a vector, which is used to produce the transgenic comouse of the invention. The specification describes transgenic non-human CC animals, especially a mouse, which are capable of producing a human CC heterologous antibodies of multiple isotypes by undergoing isotype switching. The transgenic animals have human heavy and light chain CC transgenes. The transgenes are capable of functionally rearranging a cc transgenes in the transgenes in a variable-diversity-junction (V-D-J) crecombination. The transgenes in a variable-diversity-junction gene segment. The immunoglobulin (Ig) light chain transgene comprises at least one V and Jeene segment and one constant region gene segment. The capable of the transgene comprises at least one V and Jeene segment and one constant region gene segment. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

Oligonucleotides AAV39256-64 were used to create a synthetic kappa light chain. Oligonucleotides AAV39266-64 were pooled, and amplified with AAV39248 and AAV39265. The amplification product was combined with the product of oligonucleotides AAV39244-53, and then amplified. The sequence was then cloned into a vector, which is used to produce the transgenic mouse of the invention. The specification describes transgenic non-human animals, especially a mouse, which are capable of producing a human heterologous antibodies of multiple isotypes by undergoing isotype switching. The transgenic animals have human heavy and light chain transgenes. The transgenes are capable of functionally rearranging a neterologous diversity (D) gene in a variable-diversity-junction (V-D-J) recombination. The transgenes include a heavy chain transgene comprising at least one V, D and J gene segment, and one constant region gene segment. The immunoglobulin (Ig) light chain transgene comprises at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Transgenic animal; human heterologous antibody; transgene; isotype switching; neutrophil efflux; reperfusion injury; CD4 binding; autoimmune reaction; inflammatory response; transplant rejection; acid induced lung injury, acute adult respiratory distress syndrome; ARDS; vasculitis; septic shock; allergic reaction; asthma; cystic fibrosis; PCR primer; ss.

It can also be used to treat reperfusion injury. CD4 binding antibodies are used to reduce undesirable autoimmune reactions, inflammatory responses and rejection of transplanted organs. The anti-IL-8 antibodies can reduce tissue damage and prolong survival in animal models of acute adult respiratory distress syndrome (ARDS) and acid induced lung injury. The anti-IL-8 antibodies can also be used for the treatment of vasculitis,

                                    having a genome comprising a human heavy chain transgene and a human light chain transgene. The B cells are fused to immortalized cells suitable for generating a hybridoma, which produces a detectable amount of an immunglobulin that specifically binds digoxin or Shinga-like toxin. B cells from transgenic animals can be used to generate hybridomas expressing monoclonal high affinity human sequenc antibodies. Antibodies produced from the transgenic animals of the invention can be used to treat human diseases, e.g. autoimmune diseases, cancer, infectious disease, transplant rejection, blood diseases, cancer, infectious disease, transplant rejection, blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  least one V and J gene segment and one constant region gene segment. The gene segments are heterologous to the transgenic animal. The antibody cape used to prevent efflux of neutrophils from vasculature. It can also be used to treat reperfusion injury. CD4 binding antibodies are used to reduce undesirable autoimmune reactions, inflammatory responses and rejection of transplanted organs. The anti-II-B antibodies can reduce tissue damage and prolong survival in animal models of acute adult respiratory distress syndrome (ARDS) and acid induced lung injury. The anti-II-B antibodies can also be used for the treatment of vasculitis, septic shock, allergic reactions (e.g. asthma) and cystic fibrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  transgenic mouse; human heavy chain transgene; digoxin;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                   having a genome comprising a human heavy chain transgene and a human light chain transgene. The B cells are fused to immortalized cells suitable for generating a hybridoma, which produces a detectable amount of an immunoglobulin that specifically binds digoxin or shinga-like toxin. B cells from transgenic animals can be used to generate hybridomas expressing monoclonal high affinity human sequence antibodies. Antibodies produced from the transgenic animals of the invention can be used to treat human diseases, e.g. autoimmune diseases, cancer, infectious disease, transplant rejection, blood disorders such as coagulation disorders and other diseases. The present sequence is used in the course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The specification describes transgenic animals that are capable of producing a heterologous antibody. The antibodies are isolated form a hybridoma, comprising B cells, that is obtained from a transgenic mouse
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         transgenic mouse; human heavy chain transgene; digoxin; human light chain transgene; immortalized cell; immunoglobulin; Shinga-like toxin; autoimmune disease; cancer; infectious disea transplant rejection; blood disorder; coagulation disorder; ss.

 This sequence represents a PCR primer for DNA encoding a Caenorhabditis CC elegans insulin-like protein. The amplified sequence can be used in the cmethod of the invention, for analysing an effect of expression or CC mis-expression of a C. elegans insulin-like gene, which comprises CC mis-express a C. elegans insulin-like protein (ILP) of any one of groups I, II or IV or a derivative or fragment that displays one or more CC functional activities of the C. elegans ILP. The insulin-like genes in CC c. elegans constitute very useful tools for probing the function and CC regulation of their corresponding pathways. This can be expected to lead to the discovery of new drug targets, therapeutic proteins, diagnostics associated with the function of insulin hormones in humans and other CC animals, as well as clinical problems associated with the function of insulin hormones in humans and other CC animals, as well as clinical problems associated with aging and CC validation of pesticide targets in invertebrate pests that are components CC fitnese signalling pathways. The genes are also useful for identifying C factors that are upstream of the receptor in the signal transduction pathway. The signal transduction approach for identifying factors that are upstream of the receptor in the signal transduction pathway.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Homburger

                                                                                                                                             This sequence represents a PCR primer for DNA encoding a Caenorhabditis CC elegans insulin-like protein. The amplified sequence can be used in the cc method of the invention, for analysing an effect of expression or CC mis-expression of a C. elegans insulin-like gene, which comprises observing a first nematode genetically engineered to express or CC mis-express a C. elegans insulin-like protein (ILP) of any one of groups CC I, II or IV or a derivative or fragment that displays one or more CC functional activities of the C. elegans ILP. The insulin-like genes in CC celegans constitute very useful tools for probing the function and CC regulation of their corresponding pathways. This can be expected to lead to the discovery of new drug targets, therapeutic proteins, diagnostics and prognostics useful in the treatment of diseases and clinical problems associated with the function of insulin hormones in humans and other CC animals, as well as clinical problems associated with aging and CC validation of pesticide targets in invertebrate pests that are components of these signalling pathways. The genes are also useful for identifying factors that are upstream of the receptor in the signal transduction CC superior approach for identifying factors that are upstream of the receptor in the signal transduction constant or approach for identifying factors that are upstream of the receptor in the signal transduction constant or approach for identifying factors that are upstream of the receptor in the signal transduction of superior approach for identifying factors that are upstream of the receptor in the signal transduction of superior approach for identifying factors that are upstream of the superior approach for identifying factors that are upstream of the superior approach for identifying factors that are upstream of the superior approach for identifying factors that are upstream of the superior approach for identifying factors that are upstream of the superior approach for identifying factors that are upstream of the sup
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 26

This invention describes a novel method (I) for identifying polymorphic DNA sequences which comprises forming a population of heteroduplexes, isolating and amplifying mismatched heteroduplexes to form amplicons, and determining the sequence of the amplicon. The methods are useful for identifying polymorphic DNA sequences and for comparing a reference DNA population with test populations for identifying sequences that are different (e.g. mutated sequences). The method allows large scale identification of polymorphic or mutated sequences in an individual. AAZ89641-Z89646 represent the primers used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying polymorphic DNA sequences comprising forming heteroduplexes and isolating and amplifying mismatched heteroduplexes to form

The methods are useful for identifying polymorphic DNA sequences and for comparing a reference DNA population with test populations for identifying sequences that are different (e.g. mutated sequences). The method allows large scale identification of polymorphic or mutated sequences in an individual. AAZ89641-Z89646 represent the primers used in the method of the

                                                                                     This invention describes a novel method (I) for identifying polymorphic DNA sequences which comprises forming a population of heteroduplexes, isolating and amplifying mismatched heteroduplexes to form amplicons, and determining the sequence of the amplicon. The methods are useful for identifying polymorphic DNA sequences and for comparing a reference DNA population with test populations for identifying sequences that are different (e.g. mutated sequences). The method allows large scale identification of polymorphic or mutated sequences in an individual. AAZ89641-Z89646 represent the primers used in the method of the
                                                                                                                                                                                                                                                                         Identifying polymorphic DNA sequences comprising forming heteroduplexes and isolating and amplifying mismatched heteroduplexes to form amplicons -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DNA sequences which comprises forming a population of heteroduplexes, isolating and amplifying mismatched heteroduplexes to form amplicons, and determining the sequence of the amplicon. The methods are useful for identifying polymorphic DNA sequences and for comparing a reference DNA population with test populations for identifying sequences that are different (e.g. mutated sequences). The method allows large scale identification of polymorphic or mutated sequences in an individual.

This invention describes a novel method (I) for identifying polymorphic DNA sequences which comprises forming a population of heteroduplexes, isolating and amplifying mismatched heteroduplexes to form amplicons, and determining the sequence of the amplicon. The methods are useful for identifying polymorphic DNA sequences and for comparing a reference DNA population with test populations for identifying sequences that are different (e.g. mutated sequences). The method allows large scale

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
                                                                                                                        This invention describes a novel method (I) for identifying polymorphic DNA sequences which comprises forming a population of heteroduplexes, isolating and amplifying mismatched heteroduplexes to form amplicons, and determining the sequence of the amplicon. The methods are useful for identifying polymorphic DNA sequences and for comparing a reference DNA population with test populations for identifying sequences that are different (e.g. mutated sequences). The method allows large scale identification of polymorphic or mutated sequences in an individual. AA289641-Z89646 represent the primers used in the method of the

The methods are useful for identifying polymorphic DNA sequences and for comparing a reference DNA population with test populations for identifying sequences that are different (e.g. mutated sequences). The method allows large scale identification of polymorphic or mutated sequences in an individual. AAZ89641-Z89646 represent the primers used in the method of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel method (I) for identifying polymorphic DNA sequences which comprises forming a population of heteroduplexes, isolating and amplifying mismatched heteroduplexes to form amplicons, and determining the sequence of the amplicon. The methods are useful for identifying polymorphic DNA sequences and for comparing a reference DNA population with test populations for identifying sequences that are different (e.g. mutated sequences). The method allows large scale identification of polymorphic or mutated sequences in an individual. AAZ89541-Z89646 represent the primers used in the method of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergillus fumigatutus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents selected from Onchoverva volvulus, Entamoeba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.
                                                                                                                                                                                                                                                                                                                                                                                     Human; K-ras; PCR primer; probe; capture probe; mutation detection; ligase detection reaction; LDR; p53; BRCA1; infectious disea infection; 21 hydroxylase deficiency; Turner Syndrome; obesity; cancer; oncogene; tumour suppressor; human papillomavirus; forensic environmental monitoring; food industry; feed industry; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             p53 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonucleotide probe sets occurred and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, p53 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonucleotide probe sets occurred and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences. AB192074 to AB197546 represent oligonucleotide sequences used in the exemplification of the care to the target nucleotide sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (1) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergillus funigautus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents selected from Onchoverva volvulus, Entamoeba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; K-ras; PCR primer; probe; capture probe; mutation detection; ligase detection reaction; LDR; p53; BRCA1; BRCA2; infectious disease; infection; 21 hydroxylase deficiency; Turner Syndrome; obesity; cancer; oncogene; tumour suppressor; human papillomavirus; forensic; environmental monitoring; food industry; feed industry; ss.
Designing capture oligonucleotide probes complementary oligonucleotides hybridize
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a method (M1) for designing capture oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where
                                                                                                                                                                                                                                                                                 14-APR-2000; 2000US-197271P.
                                                                                                                                                                                                                                                                                                                                                 04-APR-2001; 2001WO-US10958
                                                                                                                                                                                                                                                                                                                                                                                                               25-OCT-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WO200179548-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Capture oligonucleotide Zip ID#4017 oligo

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a method (M1) for designing capture oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (I) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and pollo virus, and parasitic infectious agents selected from Onchoverva volvulus, Entamabab histolytica and Baracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obseity defects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; N-100, N., Edition; LDR; p53; BRCA1; BNCA2; BNCA2; Injease detection reaction; LDR; p53; BRCA1; BNCA2; BNCA2; Infection; 21 hydroxylase deficiency; Turner Syndrome; obesity; cancer; oncogene; tumour suppressor; human papillomavirus; fore cancer; oncogene; fore cancer; fore cancer; fore cancer; fore cancer; for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detecting cancer involving oncogenes, tumour suppressor genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, p53 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonucleotide probe sets occurred and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences. ABI82074 to ABI97546 represent oligonucleotide sequences used in the exemplification of the present invention.

The present invention describes a method (M1) for designing capture CC oligonucleotide probes (II) will hybridise with little mismatch, where C(I) have melting temperatures within a narrow range. The method is useful CC for detecting infectious diseases caused by bacterial infectious agents CC e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal CC infectious agents e.g. Cryptococcus neoformans, Candida albicans and CR Aspergillus funiquatus, viruses e.g. T-cell lymphocytotrophis cirus, CC Epstein-Barr virus and polio virus, and parasitic infectious agents CC selected from Onchoverva volvulus, Entamoeba histolytica and Dracunculus CC medinesis. The method is also useful for detecting genetic diseases such CC as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

CC petecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the CC cancer is specifically associated with a gene selected from BRCA1 gene, companies also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning CC electron microscope and infrared microscope) the support at the cCC gets occurred and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences. ABIS2074 to of the present invention.
